Cloud Computing and Big Data

NoSQL databases

Oxford University
Software Engineering
Programme
Sept 2017

Contents

- Why NoSQL?
- ReCAP
- BigTable and Dynamo
- A summary of a few NoSQL databases
 - MongoDB, Cassandra, Couchbase,

Why NoSQL?

- Availability
 - Need better scaling capabilities
 - Elasticity
- Different schema approaches
 - Graphs, Key Values, Document, Sparse Columns, etc
- More appropriate balance in read/write performance
- Better integration with REST/SOA/Cloud

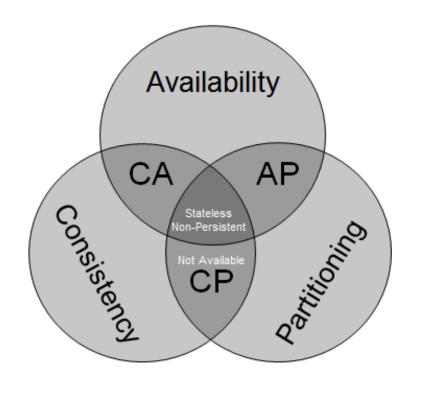

NoSQL history

- Not just a recent thing ©
- IBM IMS (Information Management System)
 - Launched in 1968
 - Used to store the bill of materials for the Saturn V rocket
 - Hierarchical model
- Still in widespread use today

ReCAP

- You can have 2 out of three:
 - Consistent
 - ACID
 - Available
 - HA / Accessible 24x7
 - Partitioned
 - Able to split into different datacentres
 - Survive network down

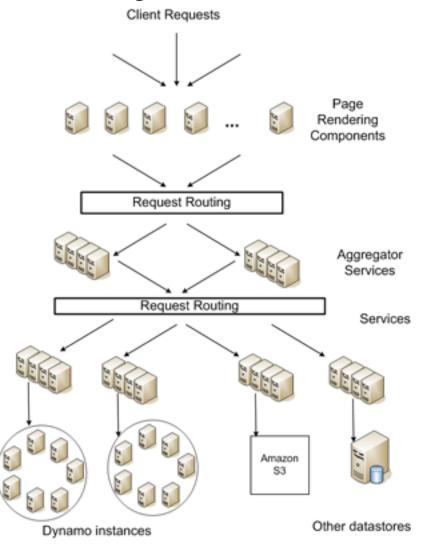

NoSQL parents

- Amazon Dynamo
 - Eventually consisten
- Google BigTable
 - Supporting very large rows
- LDM
 - Graph database

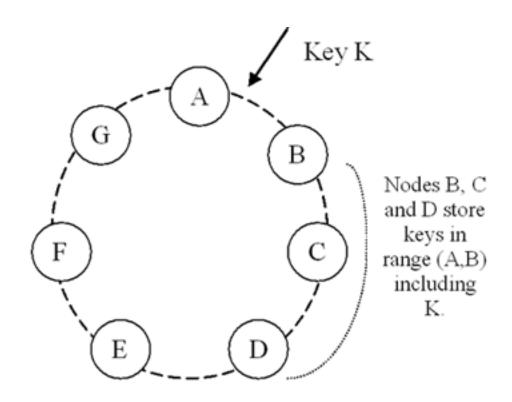

Dynamo

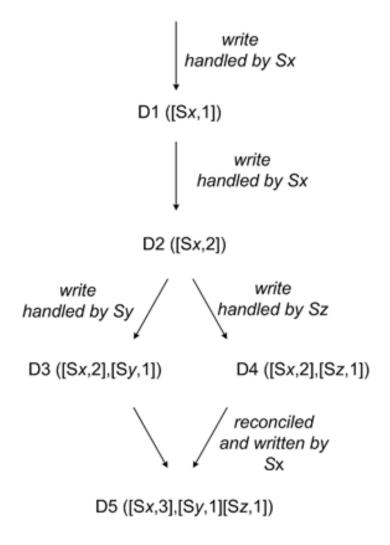

Dynamo Model

Reconciliation / Eventual Consistency

Dynamo Techniques

Problem	Technique	Advantage		
Partitioning	Consistent Hashing	Incremental Scalability		
High Availability for writes	Vector clocks with reconciliation during reads	Version size is decoupled from update rates.		
Handling temporary failures	Sloppy Quorum and hinted handoff	Provides high availability and durability guarantee when some of the replicas are not available.		
Recovering from permanent failures	Anti-entropy using Merkle trees	Synchronizes divergent replicas in the background.		
Membership and failure detection	Gossip-based membership protocol and failure detection.	Preserves symmetry and avoids having a centralized registry for storing membership and node liveness information.		

Google BigTable

- Optimized to support very large data
 - Not just many rows, but rows that cannot fit into the memory of a single server
 - Column Families allow each row to live across servers
- This table dates back to 2005

Project name	Table size (TB)	Compression ratio	# Cells (billions)	# Column Families	# Locality Groups	% in memory	Latency- sensitive?
Crawl	800	11%	1000	16	8	0%	No
Crawl	50	33%	200	2	2	0%	No
Google Analytics	20	29%	10	1	1	0%	Yes
Google Analytics	200	14%	80	1	1	0%	Yes
Google Base	2	31%	10	29	3	15%	Yes
Google Earth	0.5	64%	8	7	2	33%	Yes
Google Earth	70	_	9	8	3	0%	No
Orkut	9	_	0.9	8	5	1%	Yes
Personalized Search	4	47%	6	93	11	5%	Yes

Current NoSQL Databases

- Too many to list!
- Popular databases include:
 - MongoDB
 - Couchbase
 - Apache Cassandra
 - Apache HBase
 - Voldemort
 - Redis
 - Riak
 - Etc, etc

"NewSQL"

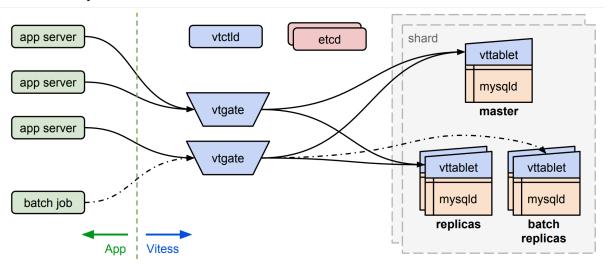

- ACID databases that aim to provide HA and Partition safety
 - VoltDB
 - NuoDB
 - Google Spanner
 - MemSQL
 - SAP HANA
- Also there are some backend engines for MySQL that aim to provide this:
 - MySQL Cluster
 - TokuDB

Vitess

Components

https://freo.me/vitess-pres

Old Shards Running

New Shards Running

DB Read Availability

DB Write Availability

DB Write Downtime

DB Write Availability

< 5 seconds

In Memory Databases

- Memory is relatively much cheaper than it used to be
- Uses snapshots or transaction logs to ensure durability
- Some NoSQL, some NewSQL
 - SAP Hana
 - Redis
 - VoltDB
 - MemSQL
 - Apache Geode

Top ten databases

283 systems in ranking, November 2015

Rank					Score

Performance (2012)

50%/50% reads/writes

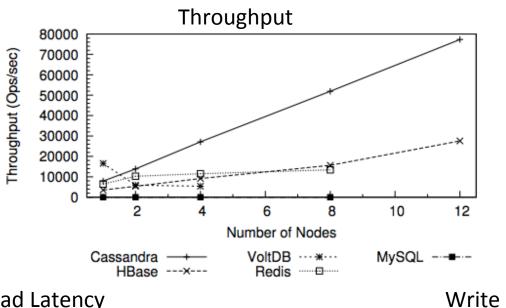

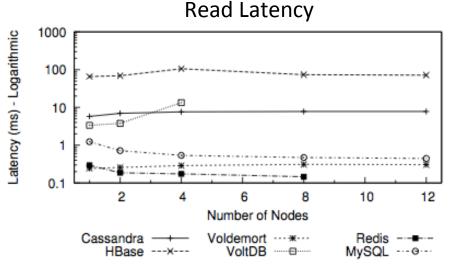

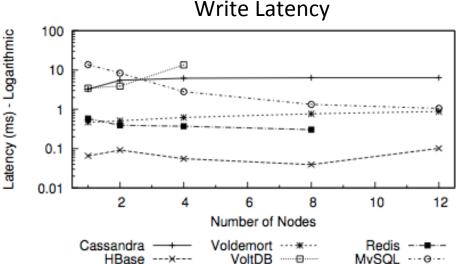

More performance (2012)

Read/Scan/Write workload

Summary of Performance benchmark (2012)

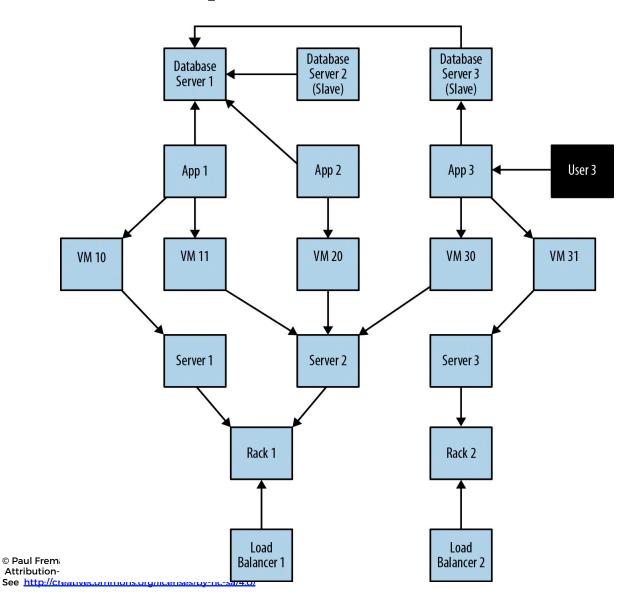

- Cassandra had the best throughput but high latency
- Voldemort had the best and most stable latency but lower throughput
- HBase had low performance per node but scaled well
 - Low write latency
- Redis, MySQL and VoltDB did not scale as well in multi-node setups

Key Value databases

- A persistent associative array or dictionary
- Simple access and fits well with programming models (especially MR)
- Indexing on other data is not often possible and can be slow
